Data Science Institute

# What factors are Related to UFO sightings?

- What are the most common weather conditions surrounding UFO sightings?
- Are there any trends in UFO sightings over time? How are they commonly described?
- Are UFO sightings related to political affiliations? What areas of the country are most likely to have UFO sightings?
- Do certain cultural phenomena influence UFO sightings?

# Data Collection

- UFO Sighting Data: National UFO Reporting Center Database
- Weather: Meteostat Python API
- Google Searches for “UFO and Alien”: Google Trends
- Sci-Fi Movie Releases and Revenue: [thenumbers.com](https://thenumbers.com)
- Alcohol Consumption by State: National Institute on Alcohol Abuse and Alcoholism
- High School Graduation Rate by State: US Census Bureau
- Political Party Affiliation by State: Pew Research Center

# A Variable Transformation:

Datetime → Season, Month, Day, Day of the week, Year, & Hour

# Analysis: Frequency

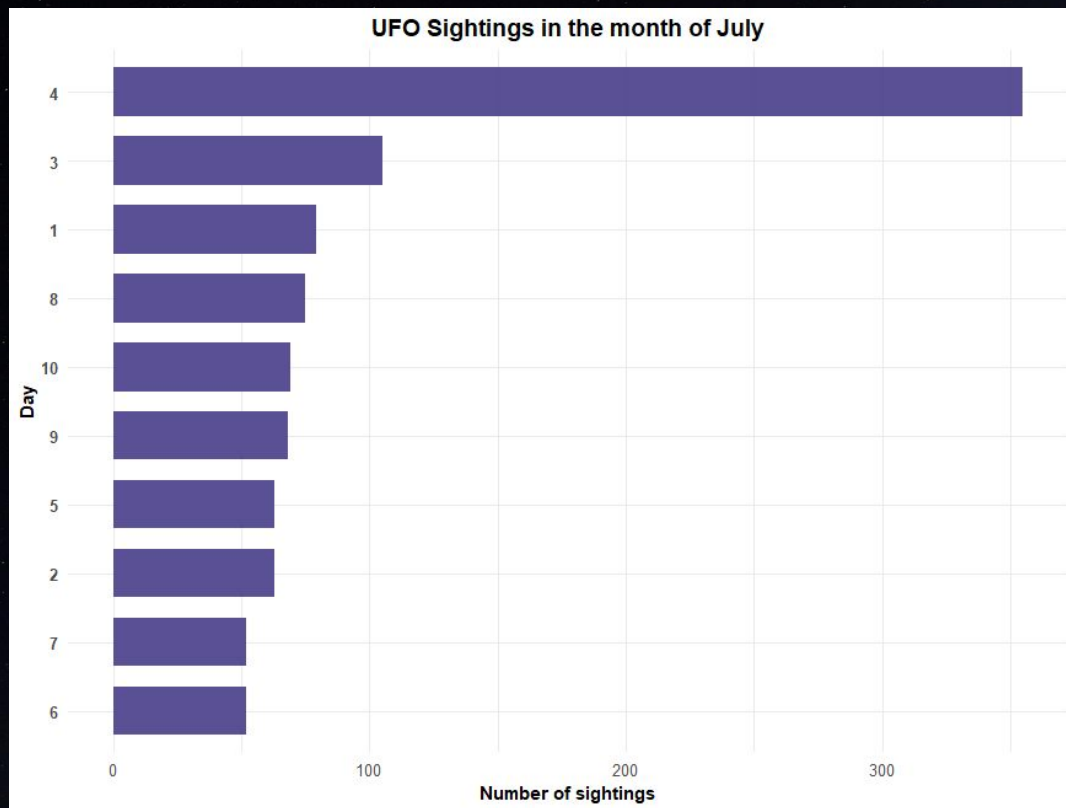

UFO Sightings throughout the day

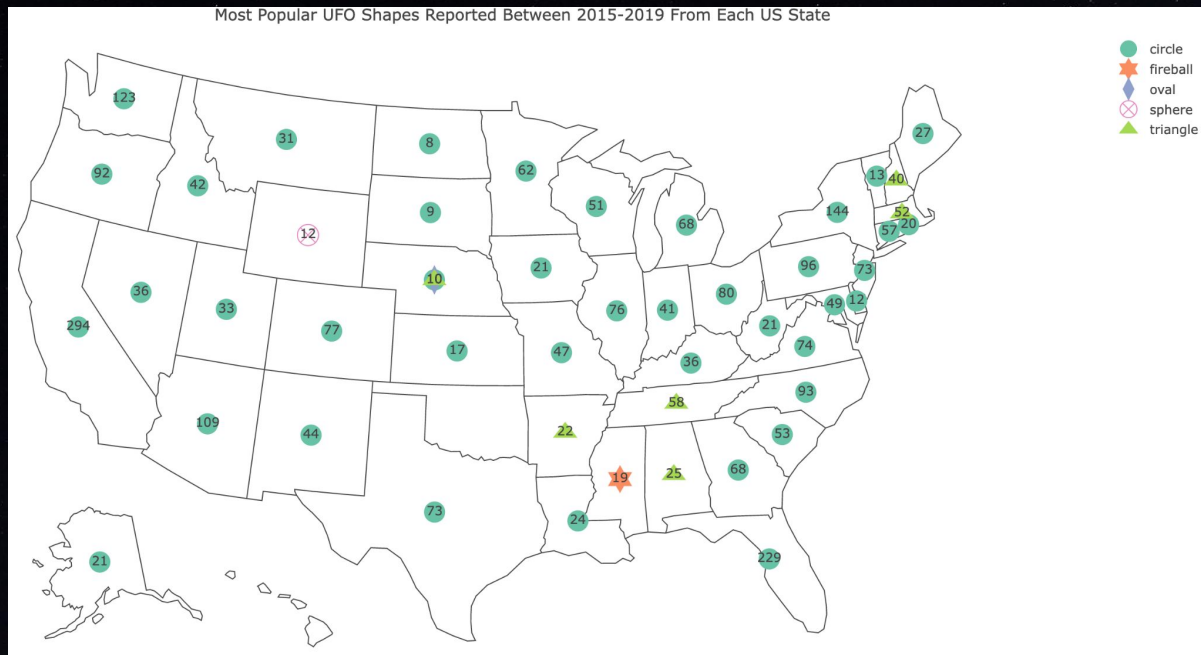

Sightings by day of week

# Analysis: Frequency

# Analysis: Shape

## Key takeaways:

1. Circle is the most popular shape across all states.
2. No association between states and other shapes.

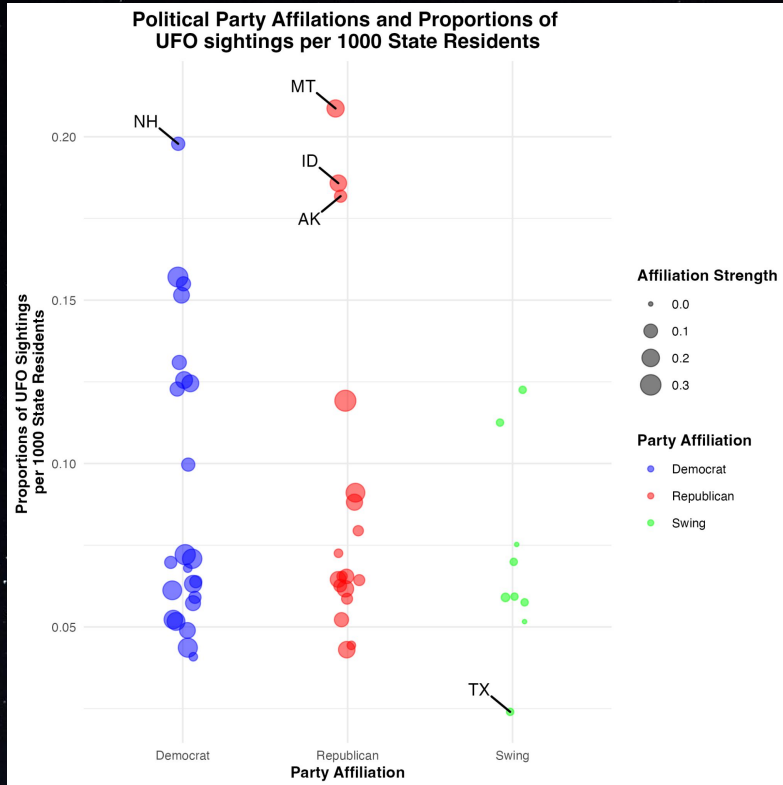

# Analysis: Shape

## Key takeaway:

The top 2 most popular shapes are evenly spread out across all states.

# Analysis: Political Affiliations

## Key takeaways:

1. No association between UFO sighting frequencies and political party affiliations.
2. All high-frequency outliers are northern states.
3. One low-frequency outlier – Texas – is on the south border.

# Limitations I: Data Limitations

## Sampling Bias

**Sampling bias towards people who report sightings**

- Most will see UFOs but not report.
- Eg. Most Californians never heard of NUFORC
- **Our data is generated only by UFO sighting REPORTS.**

## Falsified Reports

**Many reports may be falsified as NUFORC will not be able to verify testimony**

- Ulterior motives on the part of the individual - i.e. "clout chasing"
- Sensationalism on the part of the reporter to publish a big story

## Perceptual Reliability

**Even if not intentionally falsified, human perception is subject to error**

- Many aerial objects could be potentially mistaken for UFOs
- Case in point: Most sightings occur at night/weekends, most are just described as "lights"

# Limitations II: Analysis Limitations

## Multiple Possibilities

**Sighting Causality is not easily separable from conditions in which they occur**

- E.g. Do more sightings at a given time indicate more UFOs or more people outdoors?
- E.g. Do low temperature sightings really reflect sighting nature? Or just lower overall temps>

## Statistical Significance

**Relationships found on certain may not be statistically significant/robust**

- E.g. Analysis Two: Only 50 states in the dataset to draw conclusions from
- This would require more data to safely justify (e.g. County or City level)

## Limited Predictive Power

**Results may be limited to only our given geography and our selected time frame**

- Case in point: We found major time dependent variations, e.g. 50% decrease from 2015-2016
- Our analysis *likely* would not apply for a country not celebrating July 4th

# Key Takeaways & Conclusion

## Pattern Identified

- Time of day
- Certain days of year
- Months
- Education
- Alcohol

## No Pattern Identified

- Weather & Climate
- Political Affiliation
- Google Search Trends
- Sci-Fi Movie Industry
- Shape

## Limitations

- Data generation
- Analysis robustness

## Conclusion

Overall, we have successfully identified interesting factors that correlate with UFO sightings. However, there remain a lot of limitations to our data as well as analysis to be vigilant of.

Thank You!

Happy to answer questions!
